PREFACE: This collection of articles is intended for technical personnel at industrial plants and at research and educational institutions. It may also be used by students taking courses in advanced metallurgy.		
CONTENTS: The articles present the following material: original data on the production of steel in open-hearth, electric, and vacuum arc furnaces; information on the rolling of steel sheets of variable thickness along the width; results of an investigation of sheet metal made from large ingots; and problems of measuring the temperature of liquid steel. Some theoretical analysis of production processes is included, and practical recommendations are given concerning specific problems. No personal data are included. Most of the articles are accompanied by references.

... of the Acidity of Fat in Grout During Storage."

... Veterinarni Medicina, Vol. 8, No.1, Jan. 63, pp

[Authors' English summary modified]: Grains show
an increase of fat acidity in storage. Acidity in grouts
increases with the duration of storage; this no doubt is
due to the destruction of the protective outer layers of
the grain. Grout should not be stored and when this be-
comes necessary antioxidants should be added.

Editorial Board: A.M. Frankin (Resp. Ed.), Academician, O.A. Yezlin, Professor, S.I. Zhdanov (Resp. Secretary), B.M. Kabanov, Professor, I.M. Kolotyrkin, Doctor of Chemical Sciences, V.V. Losev, P.D. Lukovskiy, Professor, Z.A. Solov'yeva, V.V. Stender, Professor, and G.M. Florianovich; Ed. of Publishing House: N.G. Yegorov; Tech. Ed.: T.A. Prusakova.

PURPOSE: This book is intended for chemical and electrical engineers, physicists, metallurgists and researchers interested in various aspects of electrochemistry.

COVERAGE: The book contains 127 of the 138 reports presented at the Fourth Conference on Electrochemistry sponsored by the Department of Chemical Sciences and the Institute of Physical Chemistry, Academy of Sciences, USSR. The collection pertains to different branches of electrochemical kinetics, double layer theory, and galvanic processes in metal solutions, as well as industrial electrochemistry. Abstracts of the reports are given at the end of each division. The majority of reports are not included here have been published in periodical literature. No personalities are mentioned. References are given at the end of most of the articles.

TITLE: A New Hydrometallurgical Method¹ of Obtaining High-Purity Zinc ²¹

PERIODICAL: Rudnyy Altay, (Sovnarkhoz Vost.-Kazakhstansk. ekon. adm. r-na),
1958, Nr 1, pp 26 - 28

ABSTRACT: The authors developed a technological system of obtaining high-purity Zn by the method of electrolytic Zn refining in a $ZnSO_4$ solution with profound purification of the spent electrolyte from impurities. Electrolytic refining was carried out in rectangular tanks lined with "viniplast" (vinyl plastic), at $D = 800 - 1,000 \text{ amps/m}^2$ and $35^\circ - 40^\circ\text{C}$. Purified electrolyte, containing 100 - 110 g/l of Zn, was continuously supplied to the tanks. Anodes of 30 - 35 kg weight were cast of "TsO" and "TsV" grade electrolytic zinc. The cathode spaces in the baths were separated from the anode spaces by perchlorovinyl or caprone diaphragms on a "viniplast" carcass. The initial solution was

Card 1/2

51173

SOV/137-59-5-10155

A New Hydrometallurgical Method of Obtaining High-Purity Zinc

obtained by dissolving cathode Zn plates in a "KhCh" grade H_2SO_4 solution, prepared with distilled H_2O . Purification of the spent solution was carried out in two stages. For the primary (rough) purification the solution was subjected to agitation with Zn-dust (250 g/100 l of the solution) for 30 minutes without heating; it was then filtered on a porcelain nutch-filter. The secondary (profound) purification was carried out with the aid of complexing agents (dimethyl glyoxime and sodium diethyl-dithio carbamate) forming difficultly soluble complexes with the majority of Zn-electrolyte impurities. The complexes formed were adsorbed by activated carbon. The consumption of dimethyl glyoxime, sodium diethyl-dithio carbamate and carbon per 100 l of the solution was 10, 18 - 20 and 15 - 20 g, respectively. After purification, the solution was filtered, acidified with H_2SO_4 up to pH 3.4 - 4.2 and returned to the electrolytic bath. The cathode Zn was remelted in a quartz furnace of 20 kg capacity having a nickel-chromium heater. The purity of the Zn obtained was 99.9983 - 99.9992%. The content of impurities was (in %): Cu 1.10^{-5} - 5.10^{-5} , Fe 5.10^{-5} , Pb 5.10^{-4} - 8.10^{-4} , Cd 5.10^{-4} - 7.10^{-4} , Sn 1.10^{-5} , Ni 3.10^{-5} , Co 3.10^{-5} .

TITLE: An Electrolytic Method for the Production of High-purity Zinc
(Elektroliticheskiy metod polucheniya tsinka vysokoy chistoty)

PERIODICAL: Tr. Altaysk. gornometallurg. n.-i. in-ta, 1957, Vol 5,
pp 76-81

ABSTRACT: In order to obtain high-purity Zn from Ts-O type metal, a method of electrolytic refining of Zn in a "neutral" solution of zinc sulfate was tested under semi-industrial conditions. The apparatus employed was vinyl-plastic coated, a diaphragm made of vinyl perchlorate fibers, an electrolyte free of all impurities, and distilled water. The following optimal regimen was established for the process: $D_k = 900-1200 \text{ a/m}^2$; Zn content in the electrolyte: 90-120 g/liter; temperature of the electrolyte: $25^\circ-35^\circ$; duration of the electrolysis process: 6 hours. Cathodic Zn contained (in percent): Fe < 0.0005, Cd < 0.003, Cu < 0.0003, Pb < 0.003, and Sn < 0.0001.

TITLE Effect of Increased Rate of Electrolyte Circulation on Zinc Electrolysis Indices (Vliyaniye uvelichennoy skorosti tsirkulyatsii elektrolita na pokazateli elektroliza tsinka)

PERIODICAL. Sb. tr. Vses. n. -i. in-ta tsvetn. met., 1956 Nr 1 pp 99-111

ABSTRACT. Laboratory and industrial tests have shown that with a standard industrial electrolyte composition and with $D = 500 \text{ amp/m}^2$, a 5-fold increase in the rate of circulation of the electrolyte over the usual makes it possible to increase the Zn current efficiency by 2-2.5% and to reduce the power consumption by 1% due to reduction of bath voltage.

Fedorova, K.L.

TITLE: Semi-Industrial Tests on High Purity Zinc Production

PERIODICAL: Tsvetnyye metally, 1959, Nr 11, pp78-79 (USSR)

ABSTRACT: Experiments have been carried out by VNIITsvetmet on a pilot plant of the "Ukrtsink" establishment in order to test a method of electrolytic refining of ingot zinc in a zinc sulphate electrolyte, purifying the latter in two stages. The electrolyte was kept cool by aluminium pipes covered with bakelite varnish. The cathode metal was deposited on to "TsV" zinc cathodes, 320 x 400 mm; the cathodes were first ground and polished until a mirror finish was obtained. After this treatment their thickness was 5 mm. "TsO" zinc anodes, 27 kg in weight, were cast in special cast iron moulds. These anodes were placed in special cells in the bath which were covered with a double layer of perchlorvinyl fabric. The original electrolyte was made by two methods with a two-stage purification:

Card 1/3

4

66301

SOV/136-59-11-19/26

Semi-Industrial Tests on High Purity Zinc Production

1) by dissolving acid sulphate "KhCh" zinc salt in distilled water; 2) by dissolving metallic "TsO" zinc filings in sulphuric acid solution. The zinc concentration in the electrolyte was not less than 97 to 100 g/l. The following were used for the purification of the electrolyte: zinc dust from the Belovskiy Plant, dimethyl glyoxime "ChDA" in the form of a 1% solution, diethyl dithiocarbamate as a 3% solution, and the activated charcoal "KAD". Electrolysis was carried out under the following conditions: current density - 800 to 600 A/m², rate of circulation - 38 to 61 m³/ton of cathode zinc, duration of electrolysis - 5 to 10 hours. The purity of the zinc obtained at the cathode was 99.9998. The following conditions have been found to give the best results in the pilot plant operating at present: ✓

Card 2/3

66301

SOV/136-59-11-19/26

Semi-Industrial Tests on High Purity Zinc Production
current density - 700 A/m^2 , rate of circulation not
less than $45 \text{ m}^3/\text{ton}$ cathode zinc, duration of
electrolysis not more than 6 to 7 hours.

TITLE: Study of the thermal stability of polymer films

APPROVED FOR RELEASE: 03/14/2001

CIA-RDP86-00513R001858110004-3

SOURCE: Plasticheskiye massy, no. 5, 1965, 44-45

TOPIC TAGS: polymer film, polymer heat stability, polyethylene terephthalate, polyvinylidene chloride, polymer film shrinkage, polyvinyl chloride, polyamide, polyethylene, viscous flow temperature

ABSTRACT: The authors studied the thermal stability of films of polyethylene terephthalate and polyvinylidene chloride (15 and 30 microns thick), and found that the magnitude of the thermal deformation of the material (shrinkage) and internal stress are affected by such factors as the rate at which the temperature rises in the heat-conducting medium and the direction of cutting of the samples. Samples cut out in different directions show different values of maximum shrinkage; in longitudinal samples the shrinkage is considerably greater than in transverse ones. The authors then studied the thermal stability of longitudinal samples of polyethylene, polyvinyl chloride, polyamide, polyethylene terephthalate, and polyvinylidene chloride films. Polyethylene terephthalate films were

L 54971-65
ACCESSION NR: AP5012107

found to have the highest thermal stability. Thermal deformation of the latter films showed the presence of two temperatures at which the properties changed: 1100 corresponded to shrinkage, and 2450 to the conversion of the polymer to a state of viscous flow. The thermal deformation curves of all the films showed two such points, one of which corresponds to the start of deformation (shrinkage at 1100°C), and the other to the transition to the state of flow (fusion).
1100°C and 2450°C

ABSTRACT: Results are presented of experimental measurements of the surface tension of a liquid (distilled water or 3% solution of trisodium phosphate), and also the efficiency with which a layer of lubricating material (bleached oil, commercial vaseline) could be removed from glass following different times of exposure to ultrasound of 22.5 kcs frequency. The hypothesis is advanced that there is a possible quantitative relation between the efficiency of degreasing and the change in surface tension. V. Akulichev. [Translation of abstract]

stract 5A209 (Uch. zap. Permsk. un-t, 18, no. 4,
1961, 19-28)

TEXT: The relation of the effective velocity, determinable from
the counter-hodographs of reflected waves, and the true velocity
in the medium, covering a curvilinear reflecting boundary, was in-
vestigated. The reflecting boundary is considered to be an aggre-
gate of circular elements, for whose curvature centers arbitrary
positions may be taken in relation to the explosion points. The
curvature radii are thereby much greater than the explosion inter-
val, and each pair of counter-hodographs can be ascribed to one
circular element. A study was made of the influence of the bounda-
ry's curvature and the position of the center of curvature in re-

spect of the explosion points on the deviation of the effective velocity from the true speed. Pallets, which can be used together with isochrone and effective velocity charts to obtain information about the boundary's shape and the velocity distribution in the covering stratum, are proposed. A number of criteria are indicated for distinguishing positive and negative structures according to the data about the behavior of the effective velocities and of the travel time of reflected waves within the area under investigation.

TITLE: Study of horizontal changes in the mean stratal velocities in the Russian Platform's sedimentary strata from reflected wave hodographs

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 7, 1962, 22, abstract 7A146 (V sb. Sostoyaniye i perspektivy razvitiya geofiz. metodov poikov i razvedki polezn. iskopayemykh, M., Gostoptekhizdat, 1961, 301-306)

TEXT: A study was made of horizontal changes in the mean stratal velocity in the upper terrigenous and carbonate complex of the Russian Platform's deposits. The initial data were obtained when interpreting the hodographs of waves, reflected from the base of the upper terrigenous stratum and from interfaces in the carbonate stratum, by a method suggested by the author. It is shown that the mean stratal velocities, determined from reflected wave hodographs and by means of seismic well logging, are practically coincident. ✓

D228/D307

Study of horizontal ...

The same conclusion, but in a more cautious form, is drawn for the mean stratal velocities v_2^1 in the carbonate stratum. It was established that there are intense local changes in v_2^1 ; these can be distinctly correlated with changes in the resistivity and the porosity, exposed in the study of the cores. At the same time, local changes in v_2^1 cannot be related to geologic factors, but it is possible to explain them by systematic errors in the determination of v_2^1 . Such errors may be due to the curvature of the reflecting boundaries. Several methods are proposed for the joint qualitative and quantitative interpretation of the diagrams and graphs of v_2^1 and t_0 (the travel time of the central ray in the same stratum). These permit the exclusion of the distorting influence of curvilinear boundaries and layer-by-layer velocity zoning on the seismic constructions. /-Abstracter's note: Complete translation._/ ✓

TOPIC TAGS: hodograph, reflected wave, wave velocity, wave propagation

TRANSLATION: A method of calculating the layer and mean velocities directly from hodographs of reflected waves is described. Making use of a solution of a direct problem of the propagation time of reflected waves in a layered medium up to the surface, the author obtained approximate equations for solving the inverse problem. The total of the time on the hodographs and the time t_0 of the central rays of the waves reflected from the top and bottom of a layer is used for determining the velocity in any layer. The method is proved on theoretical hodographs constructed for several cases of the structure of a medium and in this way

TITLE: Integral determination of effective velocities from synphase axes on seismic tapes

SOURCE: Moscow. Vsesoyuznyy nauchno-issledovatel'skiy institut geofizicheskikh metodov razvedki. Prikladnaya geofizika, no. 40, 1964, 3-15

TOPIC TAGS: seismography, seismic tape, synphase axis, effective velocity, time summation

ABSTRACT: In practice, the extraction of all the information contained on seismic tapes requires a determination of the effective velocities or other quantities functionally connected to these velocities. A method is described here for the determination of such velocities by time integration along the synphase axes of seismic tapes. It is based on an integral equation derived from the method of time summation as proposed by A. K. Urupov (Uch. zap. Permskogo gos. un-ta, vol. II, no. 1, 1959). The article presents the integral approach for the determination of effective velocities and the methods for information retrieval from seismic tapes, and discusses the stability and accuracy of the

1/2

Card

L 23070-65
ACCESSION NR: AT4049374

determination and the averaging of data. The method has all the merits of known analytic approaches and determines the velocities directly from the tapes without a prior calculation of times and construction of hodographs. Information recorded by means of planimeters is lined up along the time and space axes and is transformed into graphs and charts showing the changes in average velocity. The method allows the use of automatic devices which will be constructed in the near future. Orig. art. has: 19 formulas, 5 figures, and 1 table. 0

TITLE: Use of seismic recordings with an automatic regulator of amplification in determining dynamic characteristics by the reflected wave method

SOURCE: Razvedochnaya geofizika, no. 9, 1965, 3-11

TOPIC TAGS: reflected shock wave, seismologic instrument

ABSTRACT: The authors discuss the possibility of making the method of identification of reflected waves quantitative. For this purpose, the signals received by the instrument are amplified by means of an automatic regulator of amplification. In general, the method is based on the damping of oscillations, which is produced either by dissipation or absorption of the energy. The authors reached the following conclusions: the "beta" parameters are smaller when the regulator is used. In general, the results are comparable whether the regulator is automatic or exponential or no regulator used at all. In the case of either regulator, harmonics should be identified and eliminated from the seismogram. Orig. art. has: 4 figures.

TITLE: The shape of the velocity indicatrix in the case of lamellar and fissured media based on ultrasonic simulation data

SOURCE: Ref. zh. Geofizika, Abs. 4D120

REF SOURCE: Uch. zap. Permsk. un-t, no. 127, 1965, 100-105

TOPIC TAGS: wave mechanics, longitudinal wave, acoustic wave, elastic wave

ABSTRACT: Two-dimensional models were used in experimental investigations of quasi-anisotropy in the velocity of elastic waves in lamellar and fissured media. The models were in the form of plates with systems of parallel grooves and protrusions, respectively, simulating lamination and fissility. Some of the models had two systems of grooves and protrusions intersecting at an angle of 30°, 50°, or 70°. The depth of grooves in this case was considerably smaller than the prevailing wavelength in the emitted pulse. In the case of models with a single system of grooves, the velocity indicatrix of the longitudinal wave had the shape of an ellipse. The maximum velocity was equal to the velocity in a plate without grooves, and the minimum velocity was 0.89 of that velocity. In models with two systems of grooves the indicatrix had a complex shape: directions of maxima coincided with the directions of grooves, whereas velocity minima were in the diagonal directions. An empirical formula was

TITLE: The difference in effective velocities when different filtering is used

SOURCE: Ref. zh. Geofizika, Abs. 4D122

REF SOURCE: Uch. zap. Permsk. un-t, no. 127, 1965, 8-17

TOPIC TAGS: filtration, seismography, hodograph

ABSTRACT: The distortion of V_{eff} caused by the variation of the hodograph slope and the distortion caused by the parallel translation of the phase hodograph relative to the initial velocity leads to the inequality $V_{eff}^{hf} > V_{eff}^{lf}$. During parallel hodograph translation the distortion increases with decreasing frequency and causes V_{eff} to decrease leading to the following inequality $V_{eff}^0 > V_{eff}^{nf} > V_{eff}^{lf}$. When the hodograph slope varies the distortion increases with increasing frequency causing V_{eff} to increase which leads to the following inequality $V_{eff}^{nf} > V_{eff}^{lf} > V_{eff}^0$. Thus the effects caused by these two factors may be compensated by the selection of appropriate filters and the velocity calculated from the phase hodograph of V_{eff} may be equal to the hodograph of the initial velocity V_0 . In the undercompensated case of either

Card 1/2

UDC: 550.834

ACC NR: AR6024841

$V_0 < V_{eff}$ or $V_0 > V_{eff}$ but the following always holds $V_{eff}^{hf} > V_{eff}^{lf}$. To find and determine the causes of distortion of V_{eff} it is necessary to record the vibrations as the minimum of the two essentially different filtrations. [Translation of abstract] Author's conclusions.

Paramagnetic effects of the viscous flow of oxygenated gaseous mixtures in a magnetic field and their use in the analysis of gases. / Ioan Cîrîncă / Acad. rep. populare România, 1951, 15. domeniul fizicii, Studii cercetări fiz. 8, 415-20 (1957) (Russian and French summaries).—On the basis of the fact that the presence of foreign mols. decreases the variation of η viscosity in a magnetic field, U. investigates the viscosity variation of O_2-H_2 and O_2-CH_4 mixts. through cylindrical capillaries and porous substances for 40% and 80% O_2 . Owing to the insufficient accuracy of the previous methods using a "bridge" of capillary tubes, a differential method using a micromanometer is substituted. The micromanometer readings indicate a satn. for both mixts. at 40% O_2 around 3600 oersteds for both capillaries (614 μ) and porous substances (800 μ). The effect is more attenuated for O_2-H_2 than for O_2-CH_4 : diamagnetic H_2 hampers the variation of viscosity by a magnetic field, and paramagnetic CH_4 favors it. Since the variation effect depends on concn., the findings of this method can be used for detg. the concn. of O_2 in gas mixts. with an accuracy of 0.4%. Mircea Fotiaș
